STREAKIFY – TEST SUMMARY REPORT

Automated Functional & Integration Test Execution Report

1. Project Information

Field	Details
Application	Streakify Consistency Tracker
Application Type	Web Application
Application URL	https://streakify-consistency-tracker.vercel.app
Testing Type	Functional Testing, UI Testing, Positive & Negative Testing
Testing Approach	Selenium Automation Testing
Programming Language	Java
Automation Tool	Selenium WebDriver
Testing Framework	TestNG
Build Tool	Maven
IDE	Eclipse
Browser	Google Chrome
Test Cases Designed	18
Test Status	Based on actual test execution results

2. Testing Objective

The main objective of testing the Streakify Consistency Tracker application is to verify that its core features function as expected and that users can successfully complete onboarding, manage daily tasks, schedule commitments, and interact with application settings.

The testing focuses on:

- Verifying application functionality and core user flows.
- Validating onboarding fields and navigation logic.
- Verifying task creation, multi-task addition, and deletion mechanics.
- Checking required-field validation and error handling.
- Testing invalid time ranges (Start Time > End Time) and duplicate task names.
- Verifying Scheduler functionality and commitment status selection.
- Testing theme toggle functionality and UI responsiveness.
- Checking browser navigation behavior (e.g., Back button stability).
- Identifying and documenting application defects.

3. Testing Scope

S.No.	Module
1	Website Access
2	User Onboarding
3	Home Dashboard
4	Task Management
5	Scheduler
6	Commitment Status
7	Theme Toggle
8	Browser Navigation
9	Input Validation

4. Test Environment

Environment Field	Details
Application	Streakify Consistency Tracker
Operating System	Windows
Browser	Google Chrome (Latest Stable Version)
Testing Device	Desktop/Laptop
Programming Language	Java
Automation Tool	Selenium WebDriver
Testing Framework	TestNG
Build Tool	Maven
IDE	Eclipse

5. Modules Tested

5.1 Website Access and Onboarding

- Verify that the website opens successfully.
- Verify username and age entry.
- Verify Next button functionality.
- Verify designation and goal entry.
- Verify Submit button functionality.
- Verify invalid age validation (e.g., negative values).

5.2 Home Dashboard

- Verify that the application navigates to the dashboard after onboarding.
- Verify navigation to the Task page.
- Verify the availability of task-management features.

5.3 Task Management

- Verify task creation with valid details.
- Verify the task-added alert message.
- Verify task deletion functionality.
- Verify creation of multiple tasks.
- Verify that empty task fields are rejected.
- Verify invalid start and end times handling.
- Verify duplicate task names handling.
- Verify task creation with empty date and time fields.
- Verify handling of long task names.

5.4 Scheduler

- Verify Scheduler page navigation.
- Verify date and commitment entry.
- Verify status dropdown selection.
- Verify commitment status selection as 'Completed'.

5.5 Theme and Navigation

- Verify theme toggle behavior.
- Verify browser Back button navigation behavior.

6. Testing Types Covered

Testing Type	Coverage Status
Functional Testing	**Yes**
Positive Testing	**Yes**
Negative Testing	**Yes**
UI Testing	**Yes**
Validation Testing	**Yes**
Navigation Testing	**Yes**
Automation Testing	**Yes**
Compatibility Testing	**Not confirmed**

7. Test Data Suite

Field / Parameter	Test Data Value
Username	Kaviya
Age	22
Invalid Age	-5
Designation	Software Tester
Goal	Learn Selenium Automation
Task Name	Learn Selenium
Start Time	07:00

End Time	08:00
Invalid Start Time	08:00
Invalid End Time	07:00
Duplicate Task	Practice Selenium
Additional Tasks	Practice Java, Read Book
Commitment	Walking one hour
Status	Completed

8. Governance Criteria

8.1 Entry Criteria

Testing can begin when the following conditions are met:

- The application URL is accessible.
- The test environment is fully configured.
- Java, Maven, Selenium WebDriver, and TestNG dependencies are available.
- Google Chrome browser is installed.
- Test cases and test data are prepared and validated.
- A stable internet connection is available.

8.2 Exit Criteria

Testing can be considered complete when:

- All planned test cases (18 designed cases) have been executed.
- Actual and expected results have been compared.
- Failed test cases have been thoroughly investigated.

- Identified defects have been documented in detail.
- Test execution results have been reviewed and signed off.

9. Defect Reporting Protocol

Defects identified during test execution should be recorded with the following attributes: Defect ID, Module, Defect Title, Description and Steps to Reproduce, Expected Result, Actual Result, Severity, Priority, Screenshot/Attachment, and Defect Status.

Potential validation issues covered by the automated scripts include:

- Task submission with empty fields.
- Task submission with an invalid time range (Start Time > End Time).
- Duplicate task names allowed without error notification.
- Task submission with empty date and time fields.
- Invalid negative age accepted during on boarding.

10. Risks and Assumptions

10.1 Risks

- Internet interruptions may affect Selenium script automation execution.
- Changes to the application UI locators may cause test script failures.
- Browser alerts may affect subsequent execution steps if not properly handled.
- Application state persistence may affect task-related test scenarios.
- Reusing test methods without proper cleanup may compromise test case isolation.

10.2 Assumptions

- The Streaky application is active and available for testing.
- Chrome browser and required Java/Maven dependencies remain compatible.

- Supplied UI locators match the active web application elements.
- Test data suite is valid and suitable for automation runs.
- Test execution results will be recorded from official Testing execution reports.

11. Conclusion

The Streaky Consistency Tracker automation suite consists of 18 designed test cases using Java, Selenium Web driver, and Testing. The test coverage spans core application workflows including website access, on boarding, home dashboard navigation, task management, Scheduler functionality, commitment status selection, theme toggle, browser navigation, and input validation.

The automation scripts validate both positive user scenarios and edge/negative cases. Any failed assertions during execution should be logged according to the defect reporting protocol, and final test execution status updated accordingly.
